# You've received a hip dysplasia score for your dog – what next?

- If you haven't already done so, we always recommend discussing the result with your vet.
- You should then compare the hip score with the **breed median**.
- We create breed specific statistics which include the breed median for every UK Kennel Club registered breed of dog that goes through the Hip Dysplasia Scheme, as well as the most common crossbreeds and unrecognised breeds that go through the Scheme.
- The breed median score is calculated from all the scores recorded for that breed over the previous 5 years. It represents the 'middle' score for all dogs' in that breed, meaning that half of the dogs through the Scheme will have scored lower than the median, and half will have scored higher than the median.
- We recommend only breeding from dogs with hip scores under the breed median.

## Understanding your results

The hip score on your certificate is made up of the total number of points given for different features in the hip joint, it is representative of the severity of the condition. The lower the score the better. The minimum score for each hip is 0 and the maximum is 53, giving a range for the total score of 0 to 106.

## Publication of your results

If your dog is registered with the UK Kennel Club, the results will also be published on [The Kennel Club website](#).

## What is hip dysplasia?

Hip dysplasia is a common inherited orthopaedic problem where abnormalities occur in the hip joints. These abnormalities include changes to the shape of the hip, ball, and socket and the development of osteoarthritis (a common form of arthritis).

Changes to the hip joint will begin at a young age as the puppy starts to become more active and will get worse over time. These changes can lead to excessive wear and tear of the joint, causing one or both hip joints to become defective. At this stage the hip joint(s) may be painful and can have serious effects on the health, behaviour, and welfare of the dog.

The severity of hip dysplasia can vary from a poorly shaped hip joint with osteoarthritis (a common form of arthritis) to a very deformed hip joint with advanced and very painful osteoarthritis.

## Other schemes offered by CHS

### Elbow Dysplasia Scheme

The Scheme uses X-rays to screen for abnormalities caused by elbow dysplasia in the elbow joints. The X-rays are graded by an expert panel of veterinary surgeons otherwise known as Scrutineers. The grades can then be used by breeders to make informed breeding decisions.

The Scheme is open to all dogs and breeds including crossbreeds, unrecognised breeds, and dogs not registered with The Kennel Club.

### Hereditary Eye Disease Scheme

The Eye Scheme is a clinical eye examination carried out by expert veterinary ophthalmologists (eye specialist) to identify inherited and non-inherited eye conditions in dogs. The results of the examination should be used by breeders to make informed breeding decisions.

The Eye Scheme also offers Litter Screening for congenital hereditary conditions such as collie eye anomaly and multifocal retinal dysplasia when the puppies are 5 to 12 weeks old.

The Scheme is open to all dogs and breeds including crossbreeds and non-Kennel Club registered dogs. Download our leaflet on hereditary eye disease in dogs for more information on the conditions and the scheme.

# You've received an elbow dysplasia grade for your dog – what next?

- If you haven't already done so, we always recommend discussing the result with your vet.
- Visit the [CHS website](#) to understand what the different elbow grades mean. You can also read the breed specific statistics. These show the results of all UK Kennel Club registered pedigree breeds that have been screened since 1999, as well as the most common crossbreeds and unrecognised breeds.
- We recommend only breeding from dogs that have an elbow grade of 0.

## Understanding your results

The elbow grade on your certificate is determined by the higher of the two individual grades given for each elbow, based on the presence of primary lesions and the size and extent of the secondary lesions. Grades for each elbow are not added together as they are for the two hips in the Hip Dysplasia Scheme. Grading goes from 0 'normal' to 3 'severe osteoarthritis or primary lesion with osteoarthritis'. Ideally dogs with grade 0 elbows should be chosen and certainly dogs with grade 2 or 3 elbows should not be used for breeding.

## Publication of your results

If your dog is registered with the UK Kennel Club, the results will also be published on [The Kennel Club website](#).

## What is elbow dysplasia?

Elbow dysplasia is a common inherited orthopaedic problem in dogs where the elbow doesn't develop properly. Elbow dysplasia includes a number of specific abnormalities or problems that affect different areas of the elbow joint. These cause problems by affecting the growth of the cartilage which forms the surface of the joint or the structures around it. Even a small change in the shape of one part of the joint can have major consequences for the joint function, leading to lameness (unable to walk correctly), osteoarthritis (a common form of arthritis), pain, and serious effects on the health, behaviour, and welfare of the dog.

## Other schemes offered by CHS

### Hip Dysplasia Scheme

The Scheme uses X-rays to screen for abnormalities (changes) in the hip joints. The radiographs are scored by an expert panel of veterinary surgeons otherwise known as Scrutineers. The scores can then be compared to the breed median, allowing breeders to make informed breeding decisions.

The Scheme is open to all dogs and breeds including crossbreeds, unrecognised breeds, and dogs not registered with The Kennel Club.

### Hereditary Eye Disease Scheme

The Eye Scheme is a clinical eye examination carried out by expert veterinary ophthalmologists (eye specialist) to identify inherited and non-inherited eye conditions in dogs. The results of the examination should be used by breeders to make informed breeding decisions.

The Eye Scheme also offers Litter Screening for congenital hereditary conditions such as collie eye anomaly and multifocal retinal dysplasia when the puppies are 5 to 12 weeks old.

The Scheme is open to all dogs and breeds including crossbreeds and non-Kennel Club registered dogs. Download our leaflet on hereditary eye disease in dogs for more information on the conditions and the scheme.

I hereby declare that the dog submitted for examination under the BVA/KC/ISDS Canine Health Scheme is the one described above and that the information obtained may be made available for research purposes and may be published. Any appeal against the results specified below must be made to the BVA (for details see EPWP1).

I understand and agree that the use of a mydriatic agent Tropicamide is necessary to facilitate a complete examination of the eye and that a local anaesthetic will be used where gonioscopy is required.

I understand that the personal information provided in this form will be used to administer the eye examination service and will be retained for 7 years for accounting purposes on an electronic system. My personal information may be used from time to time to provide me with relevant information relating to CHS services or for other lawful reasons.

<b>Order #:</b>	138997	<b>Registered Name:</b>	Herbie
<b>Ordered By:</b>		<b>Breed:</b>	Australian Labradoodle
<b>Ordered:</b>	May 9, 2022	<b>Sex:</b>	Male
<b>Received:</b>	May 25, 2022	<b>DOB:</b>	June 2021
<b>Reported:</b>	June 1, 2022	<b>Registration #:</b>	-
		<b>Microchip #:</b>	981 0000 12334 274

### Results:

Disease	Gene	Genotype	Interpretation
Degenerative Myelopathy	<i>SOD1</i>	WT/WT	Normal (clear)
Exercise-Induced Collapse	<i>DNM1</i>	WT/WT	Normal (clear)
Hereditary Nasal Parakeratosis	<i>SUV39H2</i>	WT/WT	Normal (clear)
Progressive Retinal Atrophy, Cone-Rod Dystrophy 4	<i>RPGRIP1</i>	WT/WT	Normal (clear)
Progressive Retinal Atrophy, Progressive Rod-Cone Degeneration	<i>PRCD</i>	WT/WT	Normal (clear)
Retinal Dysplasia/Oculoskeletal Dysplasia 1	<i>COL9A3</i>	WT/WT	Normal (clear)
Von Willebrand Disease I	<i>VWF</i>	WT/WT	Normal (clear)

WT, wild type (normal); M, mutant; Y, Y chromosome (male)

### Interpretation:

Molecular genetic analysis was performed for seven specific mutations reported to be associated with disease in dogs. We identified two normal copies of the DNA sequences in seven mutations tested. Thus, this dog is not at an increased risk for the diseases associated with these seven mutations.

### Recommendations:

No mutations were identified. Thus, this dog is not at an increased risk for the diseases caused by or associated with the mutations tested. Because this dog is "clear" of these mutations, this dog will only pass the normal genes on to its offspring. Normal results do not exclude inherited mutations not tested in these or other genes that may cause medical problems or may be passed on to offspring. Paw Print Genetics® has genetic counseling available to you at no additional charge to answer any questions about these test results, their implications and potential outcomes in breeding this dog.

**Helen F Smith, PhD**  
Associate Laboratory Director

**Christina J Ramirez, PhD, DVM, DACVP**  
Medical Director

Paw Print Genetics® performed the tests listed on this dog. The genes/diseases reported here were selected by the client. Normal results do not exclude inherited mutations not tested in these or other genes that may cause medical problems or may be passed on to offspring. The results included in this report relate only to the items tested using the sample provided. These tests were developed and their performance determined by Paw Print Genetics. This laboratory has established and verified the test(s) accuracy and precision with >99.9% sensitivity and specificity. The presence of mosaicism may not be detected by this test. Non-paternity may lead to unexpected results. This is not a breed identification test. Because all tests performed are DNA-based, rare genomic variations may interfere with the performance of some tests producing false results. If you think any results are in error, please contact the laboratory immediately for further evaluation. In the event of a valid dispute of results claim, Paw Print Genetics will do its best to resolve such a claim to the customer's satisfaction. If no resolution is possible after investigation by Paw Print Genetics with the cooperation of the customer, the extent of the customer's sole remedy is a refund of the fee paid. In no event shall Paw Print Genetics be liable for indirect, consequential or incidental damages of any kind. Any claim must be asserted within 60 days of the report of the test results.
